Solve with us 10 - Not Graded

This assignment will not be graded and is only for practice.
Key Points: 1Key Points: 1

- Gradient of a function:Gradient of a function: If f is a scalar valued function defined on a domain D in R^n, then the gradient ∇f is defined as the vector valued function $\left(\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \ldots, \frac{\partial f}{\partial x_n}\right)$.
- If ∇f exists and is continuous in an open ball around the point $(a_1, a_2, \ldots, a_n)$, then the directional derivative of the function f at $(a_1, a_2, \ldots, a_n)$ in the direction of a vector v is given by the dot product of the gradient of the function at $(a_1, a_2, \ldots, a_n)$ with the unit vector in the direction of v i.e.,

$$D_v f(a_1, a_2, \ldots, a_n) = \nabla f(a_1, a_2, \ldots, a_n) . \frac{v}{||v||}$$

- If ∇f exists and is continuous in an open ball around the point $(a_1, a_2, \ldots, a_n)$, then the gradient is the direction in which the directional derivative at P is maximized amongst all directions, i.e., the directional derivative at P is maximized amongst all the directions in the direction of the vector $\frac{\nabla f(a_1, a_2, \ldots, a_n)}{||\nabla f(a_1, a_2, \ldots, a_n)||}$.
- If ∇f exists and is continuous in an open ball around the point $(a_1, a_2, \ldots, a_n)$, then the direction opposite to the gradient is the direction in which the directional derivative at P is minimized amongst all directions, i.e., the directional derivative at P is minimized amongst all the direction in the direction of the vector $\frac{-\nabla f(a_1, a_2, \ldots, a_n)}{||\nabla f(a_1, a_2, \ldots, a_n)||}$.
- If ∇f exists and is continuous in an open ball around the point $(a_1, a_2, \ldots, a_n)$, then the maximum value amongst all directional derivatives at P is

$$\nabla f(a_1, a_2, \ldots, a_n) . \frac{\nabla f(a_1, a_2, \ldots, a_n)}{||\nabla f(a_1, a_2, \ldots, a_n)||} = \frac{||\nabla f(a_1, a_2, \ldots, a_n)||^2}{||\nabla f(a_1, a_2, \ldots, a_n)||} = ||\nabla f(a_1, a_2, \ldots, a_n)||$$

Similarly, If ∇f exists and is continuous in an open ball around the point $(a_1, a_2, \ldots, a_n)$, then the minimum value amongst all directional derivatives at P is

$$\nabla f(a_1, a_2, \ldots, a_n) . \frac{-\nabla f(a_1, a_2, \ldots, a_n)}{||\nabla f(a_1, a_2, \ldots, a_n)||} = -\frac{||\nabla f(a_1, a_2, \ldots, a_n)||^2}{||\nabla f(a_1, a_2, \ldots, a_n)||} = -||\nabla f(a_1, a_2, \ldots, a_n)||$$

Key Points: 3

- Definition: Consider a scalar valued multivariable function $f : R^n \to R$. A point $(a_1, a_2, \dots, a_n) \in R^n$ is said to be a critical point of the function f, if $\nabla f(a_1, a_2, \dots, a_n) = 0$ or at least one of $f_{x_i}(a_1, a_2, \dots, a_n)$ for $i = 1, 2, \dots, n$ does not exist.
- Steps to find critical points of a function,

i) Find the partial derivatives f_{x_i} for $i = 1, 2, \ldots, n$. If one of $f_{x_i}(a_1, a_2, \ldots, a_n)$ for $i = 1, 2, \ldots, n$ does not exist then $(a_1, a_2, \ldots, a_n)$ is a critical point.

ii) Otherwise, find the all possible point $(a_1, a_2, \ldots, a_n) \in R^n$ such that $f_{x_i}(a_1, a_2, \ldots, a_n) = 0$ for all $i = 1, 2, \ldots n$, simultaneously.

- A function $f(x_1, x_2, \ldots, x_n)$ has a local minimum at the point $(a_1, a_2, \ldots, a_n)$ if $f(x_1, x_2, \ldots, x_n) \geq f(a_1, a_2, \ldots, a_n)$ for all points $(x_1, x_2, \ldots, x_n)$ in some open ball around $(a_1, a_2, \ldots, a_n)$.
- A function $f(x_1, x_2, \ldots, x_n)$ has a local maximum at the point $(a_1, a_2, \ldots, a_n)$ if $f(x_1, x_2, \ldots, x_n) \leq f(a_1, a_2, \ldots, a_n)$ for all points $(x_1, x_2, \ldots, x_n)$ in some open ball around $(a_1, a_2, \ldots, a_n)$.
- Local extrema are critical points.
- Not all critical points are local extrema. Those critical points at which the gradient exists and is 0 but are not local extrema, are called saddle points.
- A global (or absolute) maximum/minimum is a point for which the function value is maximum/minimum amongst all points in the domain. It always exists when the domain is closed and bounded and can be found by comparing the function values at all critical points in the domain as well as on successive boundaries.
