

AQ5.4: Activity Questions 4 - Not Graded

This assignment will not be graded and is only for practice.

Let $T(x, y, z) = mx + ny + pz$ denote the total amount of money a multiplex made from a specific movie, in one day by selling x number of tickets for the morning show, y number of tickets for the evening show, and z number of tickets for the night show, where m , n and p are the prices of each ticket of that movie in the morning, evening, and night show, respectively.

In the multiplex, 2 Malayalam movies, 1 Hindi movie, 1 Bengali movie, and 1 English movie are running parallelly in one week. Suppose there are 3 shows (Morning, Evening, Night) per day for each of the Malayalam movies and the English movie, whereas 2 shows (Evening, Night) per day for the Hindi and the Bengali movie. Ticket price (irrespective of morning, evening, and night shows) for each Malayalam movie is ₹200, Hindi movie is ₹250, Bengali movie is ₹250, and English movie is ₹300. The number of tickets sold in a particular day is given in Table M2W5AQ2:

Answer questions 1 to 8 using the given data above.
