Higher order partial derivatives: Higher order partial derivatives:

- Let f be a scalar valued function defined on a domain D in R^2 . Then the second order partial derivatives are the partial derivatives of the partial derivatives.

Notations: Notations:

- The partial derivative of $\frac{\partial f}{\partial x} \frac{\partial}{\partial x} f$ with respect to x is denoted by $f_{xx} = \frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x} \frac{\partial f}{\partial x}$.
 - The partial derivative of $\frac{\partial f}{\partial y} \frac{\partial}{\partial x} f$ with respect to x is denoted by $f_{yx} = \frac{\partial^2 f}{\partial x \partial y} = \frac{\partial}{\partial x} \frac{\partial f}{\partial y}$.
 - The partial derivative of $\frac{\partial f}{\partial x} \frac{\partial}{\partial y} f$ with respect to y is denoted by $f_{xy} = \frac{\partial^2 f}{\partial y \partial x} = \frac{\partial}{\partial y} \frac{\partial f}{\partial x}$.
 - The partial derivative of $\frac{\partial f}{\partial y} \frac{\partial}{\partial y} f$ with respect to y is denoted by $f_{yy} = \frac{\partial^2 f}{\partial y^2} = \frac{\partial}{\partial y} \frac{\partial f}{\partial y}$.
- Let $f(x_1, x_2, \dots, x_n)$ be a function defined on a domain D in R^n . Then the second order partial derivatives of f are defined analogously as the partial derivatives of the partial derivatives.

Notation: Notation: The partial derivative of $\frac{\partial f}{\partial x_i} \frac{\partial}{\partial x_j} f$ with respect to x_j is denoted as $f_{x_i x_j} = \frac{\partial^2 f}{\partial x_j \partial x_i}$.

Note: Note: In general, the mixed partial derivatives $f_{x_i x_j}$ and $f_{x_j x_i}$ are not necessary equal.

Clairaut's Theorem: Clairaut's Theorem : Let $f(x_1, x_2, \dots, x_n)$ be a scalar valued function defined on a domain D containing a point $a = (a_1, a_2, \dots, a_n)$ in R^n . If both $f_{x_i x_j}$ and $f_{x_j x_i}$ are defined and continuous in an open ball containing the point a , then

$$f_{x_i x_j}(a) = f_{x_j x_i}(a).$$

k th-order partial derivatives: Let $f(x_1, x_2, \dots, x_n)$ be a function defined on a domain D in R^n . Then the k th-order partial derivatives of f are defined analogously by taking successive partial derivatives for k -times.

Notation: Notation: The notation for k th-order partial derivative is

$$f_{x_{i_1} x_{i_2} \dots x_{i_k}} = \frac{\partial^k f}{\partial x_{i_k} \dots \partial x_{i_1}} = \frac{\partial}{\partial x_{i_k}} \dots \frac{\partial}{\partial x_{i_1}} f$$

Modified statement of Clairaut's Theorem: Modified statement of Clairaut's Theorem : Let $f(x_1, x_2, \dots, x_n)$ be a scalar valued function defined on a domain D containing a point $a = (a_1, a_2, \dots, a_n)$ in R^n whose k th-order partial derivatives are all continuous in an open ball containing the point a . For any integers $i_1, i_2, \dots, i_k$ between 1 and n , if $j_1, j_2, \dots, j_k$ is a reordering of $i_1, i_2, \dots, i_k$, then

$$f_{x_{i_1} x_{i_2} \dots x_{i_k}}(a) = f_{x_{j_1} x_{j_2} \dots x_{j_k}}(a). f_{x_{i_1} x_{i_2} \dots x_{i_k}}(\sim a) = f_{x_{j_1} x_{j_2} \dots x_{j_k}}(\sim a).$$

A consequence of this theorem is that
we don't need to keep track of the order in which we take partial derivatives.
we don't need to keep track of the order in which we take partial derivatives.

Hessian matrix: Let $f(x_1, x_2, \dots, x_n)$ be a scalar valued function defined on a domain D in R^n . Then the Hessian matrix of f is defined as

$$Hf = \begin{pmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \dots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \dots & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \dots & \frac{\partial^2 f}{\partial x_n^2} \end{pmatrix}. Hf = \begin{pmatrix} \partial_{x_1}^2 f & \partial_{x_1} \partial_{x_2} f & \dots & \partial_{x_1} \partial_{x_n} f \\ \partial_{x_2} \partial_{x_1} f & \partial_{x_2}^2 f & \dots & \partial_{x_2} \partial_{x_n} f \\ \vdots & \vdots & \ddots & \vdots \\ \partial_{x_n} \partial_{x_1} f & \partial_{x_n} \partial_{x_2} f & \dots & \partial_{x_n}^2 f \end{pmatrix}.$$

$Hf(a_1, a_2, \dots, a_n)$ means that all of the entries of Hf are evaluated at the point $(a_1, a_2, \dots, a_n)$, which must be a point in the domain of f .
