Let AA be a $2 \times 2 \times 2$ matrix, which is given as $\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} [a_{11} a_{21} a_{12} a_{22}]$. Define the following

matrices :

$B = \begin{bmatrix} a_{11} - a_{21} & a_{12} - a_{22} \end{bmatrix}$ $B = [a_{11} - a_{21} a_{21} a_{12} - a_{22} a_{22}]$, $C = \begin{bmatrix} a_{11} - a_{12} & a_{21} - a_{22} \end{bmatrix}$ $C = [a_{11} - a_{12} a_{21} - a_{22} a_{12} a_{22}]$,

$D = \begin{bmatrix} a_{11} + a_{21} & a_{12} - a_{22} \end{bmatrix}$ $D = [a_{11} + a_{21} a_{21} a_{12} - a_{22} a_{22}]$, $E = \begin{bmatrix} a_{11} - a_{21} & a_{12} + a_{22} \end{bmatrix}$ $E = [a_{11} - a_{21} a_{21} a_{12} + a_{22} a_{22}]$

Which of the matrices among B, C, D , and E have the same determinant as that of the matrix AA , for any real numbers $a_{11}, a_{12}, a_{21}, a_{22}$?

[Hint: Try to observe whether B, C, D, E can be obtained from AA by row or column operations of Type 2 mentioned in the key points.]

- B can be obtained by a row operation of Type 2.
- C can be obtained by column operation of Type 2.
- D cannot be obtained by a row operation or column operation of Type 2. Check the determinant of D and see whether it matches with determinant of A or not.
- E cannot be obtained by a row operation or column operation of Type 2. Check the determinant of E and see whether it matches with determinant of A or not.
