Key Points: 3Key Points: 3

- Definition:Definition: Consider a scalar valued multivariable function $f: R^n \rightarrow R$f : Rn → R. A point $(a_1, a_2, \ldots, a_n) \in R^n$(a1, a2, … , an) ∈ Rn is said to be a critical point of the function ff, if $\nabla f(a_1, a_2, \ldots, a_n) = 0$∇f(a1, a2, … , an) = 0 or at least one of $f_{x_i}(a_1, a_2, \ldots, a_n)$fxi(a1, a2, … , an) for $i = 1, 2, \ldots, n$i = 1, 2, … , n does not exist.
- Steps to find critical points of a function,

i) Find the partial derivatives f_{x_i} fxi for $i = 1, 2, \ldots, n$i = 1, 2, … , n. If one of $f_{x_i}(a_1, a_2, \ldots, a_n)$fxi(a1, a2, … , an) for $i = 1, 2, \ldots, n$i = 1, 2, … , n does not exist then $(a_1, a_2, \ldots, a_n)$(a1, a2, … , an) is a critical point.

ii) Otherwise, find the all possible point $(a_1, a_2, \ldots, a_n) \in R^n$ (a1, a2, … , an) ∈ Rn such that $f_{x_i}(a_1, a_2, \ldots, a_n) = 0$fxi(a1, a2, … , an) = 0 for all $i = 1, 2, \ldots n$i = 1, 2, … n, simultaneously.

- A function $f(x_1, x_2, \ldots, x_n)$f(x1, x2, … , xn) has a local minimum at the point $(a_1, a_2, \ldots, a_n)$(a1, a2, … , an) if $f(x_1, x_2, \ldots, x_n) \geq f(a_1, a_2, \ldots, a_n)$f(x1, x2, … , xn) ≥ f(a1, a2, … , an) for all points $(x_1, x_2, \ldots, x_n)$(x1, x2, … , xn) in some open ball around $(a_1, a_2, \ldots, a_n)$(a1, a2, … , an).
- A function $f(x_1, x_2, \ldots, x_n)$f(x1, x2, … , xn) has a local maximum at the point $(a_1, a_2, \ldots, a_n)$(a1, a2, … , an) if $f(x_1, x_2, \ldots, x_n) \leq f(a_1, a_2, \ldots, a_n)$f(x1, x2, … , xn) ≤ f(a1, a2, … , an) for all points $(x_1, x_2, \ldots, x_n)$(x1, x2, … , xn) in some open ball around $(a_1, a_2, \ldots, a_n)$(a1, a2, … , an).
- Local extrema are critical points.
- Not all critical points are local extrema. Those critical points at which the gradient exists and is 0 but are not local extrema, are called saddle points.
- A global (or absolute) maximum/minimum is a point for which the function value is maximum/ minimum amongst all points in the domain. It always exists when the domain is closed and bounded and can be found by comparing the function values at all critical points in the domain as well as on successive boundaries.
